Relative atomic mass

Exam-Style Periodic Table PDF with Whole-Number Atomic Mass (black and white): notes

About this sheet

A data-sheet layout with a key that labels the atomic number, symbol, name and relative atomic mass. The 57–71 and 89–103 placeholders stand in for the lanthanoids and actinoids, which are set out in separate rows below. Masses are whole numbers, with chlorine at 35.5 and copper at 63.5.

Best for

Practice that matches the look of exam-board data sheets, so students are used to the layout before the exam.

Printing

Plain white tiles with black outlines use very little ink and photocopy cleanly, so it suits class sets and sheets students will write on. Sized for A4 landscape: print at 100% (actual size) so the margins stay correct.

What the data shows

The first 20 elements read H 1, He 4, Li 7, Be 9, B 11, C 12, N 14, O 16, F 19, Ne 20, Na 23, Mg 24, Al 27, Si 28, P 31, S 32, Cl 35.5, Ar 40, K 39, Ca 40.

Chlorine (35.5) and copper (63.5) are the two elements printed as halves; the rest are whole numbers, and radioactive elements show a bracketed mass number.

The key at the top explains each part of a tile, and the lanthanide and actinide series are labelled beneath the main table.

How the table is organised

Atomic number counts the protons in an atom's nucleus and fixes each element's place in the table. Moving down a group adds a new electron shell, so atomic radius grows and metallic character increases.
